GGOO Hydraulic System

For study purposes only

The Hydraulic System is about the <u>storage</u> and <u>delivery</u> of hydraulic fluid (Skydrol) under high pressure to actuate various systems

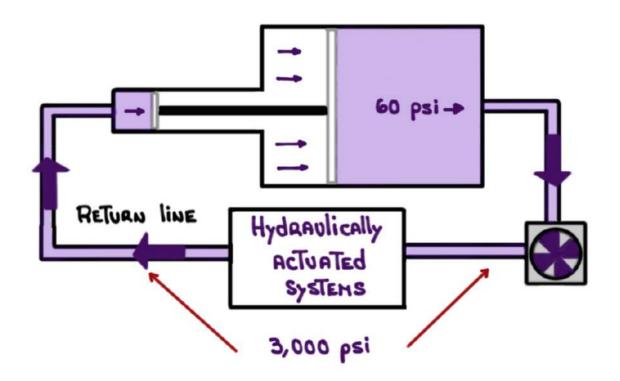

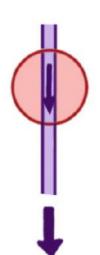

HydRAULIC SYSTEM COMPONENTS

RESERVOIR: TO STORE fluid

- COMPRESSED by bOOTSTAAP TO PREVENT
 hydraulic pump cavitation
- · LOCATED IN THE TAIL COMPARTMENT
- System must be pressurized for Accurate quantity checks
- · Single CHAMBER

Shutoff value: To shutoff hydraulic fluid to the Engine in the event of Engine Fire or failure • Located in the Tail compartment and activated VIA Fire Handles

PUMP: TO PRESSURIZE SYSTEM

- · ENGINE-DRIVEN PUHP
- · LOCATED IN THE ENGINE'S GEARbox
- 3,025 ± 50 Psi

Filter Manifold: To filter hydraulic fluid and control direction of flow

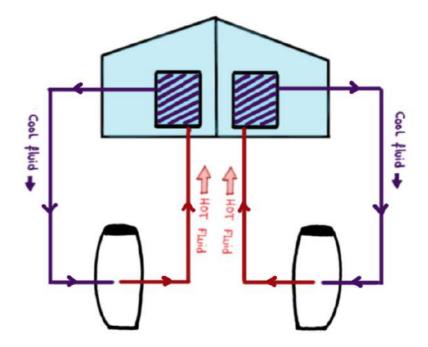

- · Located in The Tail comparitnent
- · LEFT HydRAulic SysTEM: Six (6) filters
- · Right HydRAUlic System: Three (3) filters

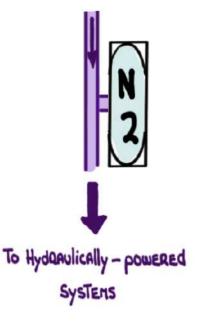

Hydraulic fluid-To-fuel HEAT Exchanger:

To cool hydraulic fluid and To warm up cold fuel

- · LOCATED in The on-side fuel Hopper
- · Continuous flow

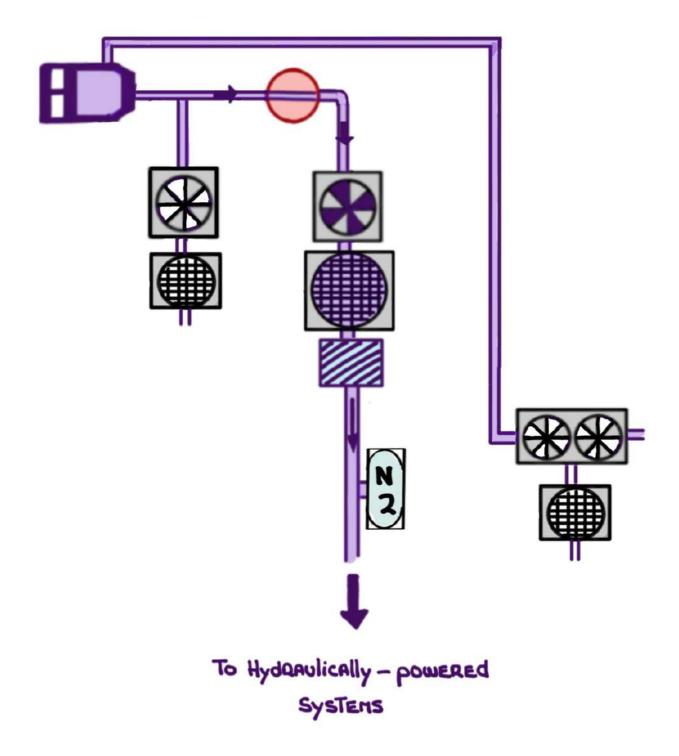

ACCUMULATOR: TO Absorb System shocks

- · PRE-changed To 1,200 Psi D 70°F
- · Absorbs fluid shocks within the system
- SERVICED with Nitrogen
 Located in the Tail compartment

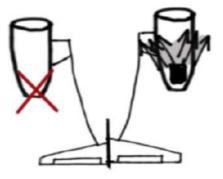

L Hydraulic System

- INDEPENDENT AND ISOLATED FROM Right HydRAULIC SYSTEM
- Supported by The AUX pump and PTU sub-systems

- Powered by The LEFT Engine - driven pump (EDP)

- · MOUNTED ON ENGINE GEARDOX
- · CONSTANT PRESSURE, VARIABLE VOIUME PUMP
- · PRESSURIZES fluid To 3,025 ± 50 Psi
- · FLOW RATE VARIES based on power setting
- · FAILURE OF EDP RESULTS IN LOSS OF:

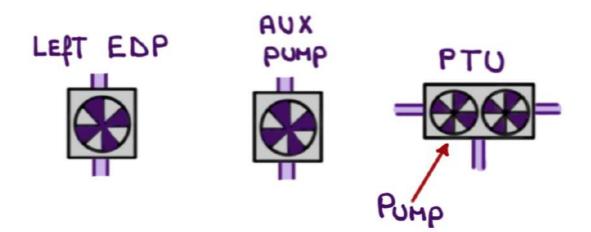

1 LEFT THAUST REVERSER

(1) Mid spoiler panels

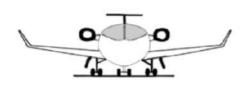

(185 KCAS/MO.90 MAXIMUN)

- Offload feature:
 - Automatically controlled by Electronic Engine Controller (ECC)
 - Reduces pump outlet pressure in flight when engine drops below idle (<55% Na)
 - Reduces daag on engine to maximize aigstart
 capability
 - · No windHilling PRESSURE
- LARGEST RESERVOIR:
 - · Considered full at 2.5 gallons
 - · MUST be pressurized for accurate reading
 - · Supplies Hydraulic fluid To:

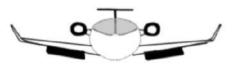

- Majority of Aircraft Hydraulic functions:

· LANDING GEAR

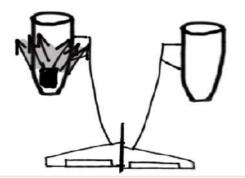

FLAPS

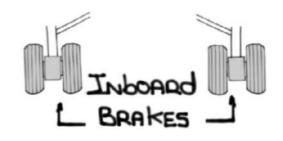

· Mid spoiler panels

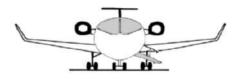

· LEFT THAUST REVERSER

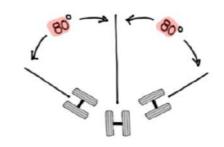

· BRAKES

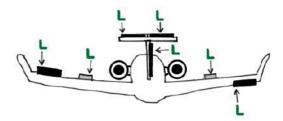

· MAIN DOOR

· Nose Wheel Steering

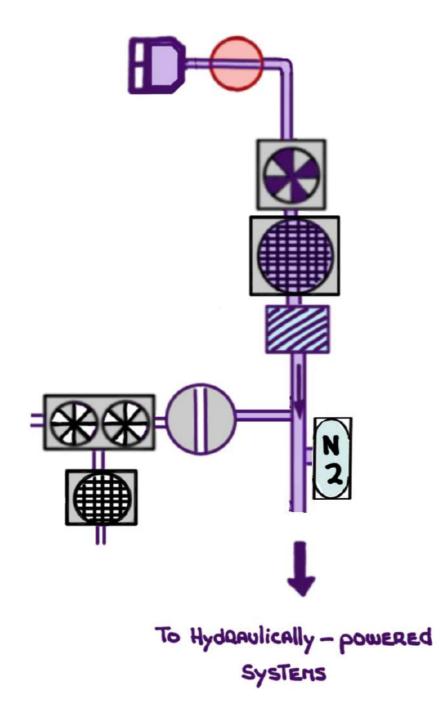

· Flight Controls

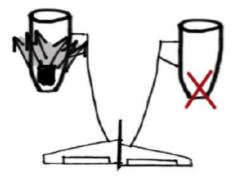

R Hydraulic System

- INDEPENDENT AND ISOLATED FROM LEFT HYDRAULIC SYSTEM

- POWERED by The <u>Right Engine - driven pump</u> (EDP)

- · MOUNTED ON ENGINE GEARbox
- · CONSTANT PRESSURE, VARIABLE VOIDHE PUMP
- · PRESSURIZES fluid To 3,025 ± 50 Psi
- · FLOW RATE VARIES based on power setting
- · FAILURE OF EDP RESULTS IN LOSS OF:

1 Right THRUST REVERSER

INDOARD Spoiler PANELS

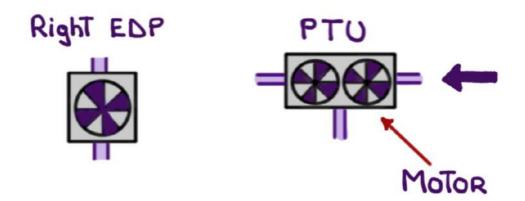

(185 KCAS/MO.90 MAXIMUM)

- Offload feature:

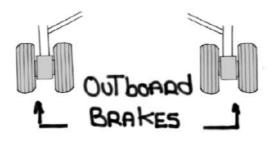

- Automatically controlled by Electronic Engine Controller (ECC)
- Reduces pump outlet pressure in flight when engine drops below idle (<55% N2)
- Reduces dang on engine to maximize aiastart
 capability
- · No windmilling PRESSURE
- SMALLEST RESERVOIR:
 - · Considered full at 1.3 gallons

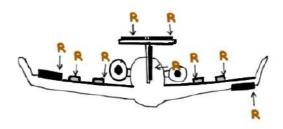

- · Must be pressurized for accurate reading
- · Supplies HydRAulic fluid To:

- ACTUATES THE following AIRCRAFT HydRAulic functions:
 - BRAKES

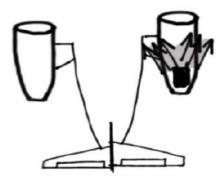

· Flight Controls

· INDOARD / OUTBOARD PANELS · Right THRUST REVERSER

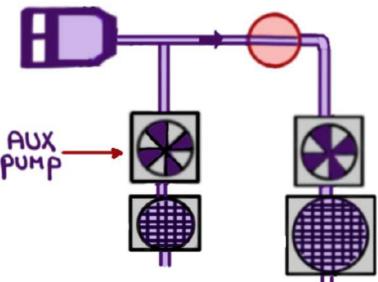

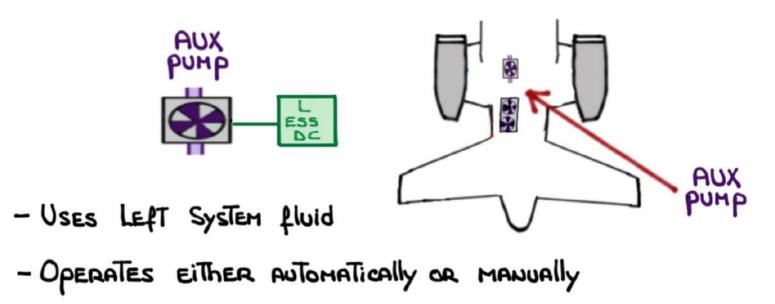

AUXILIARY (AUX) HydRAulic SysTEM

- <u>Supplements</u> The Left Hydraulic System

- Powered by The AUX pump
 - · LOCATED IN THE TAIL COMPARTMENT below THE LEFT Hydraulic Reservoir
 - · ELECTRICALLY powered by LESS DC bus

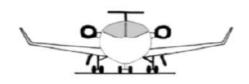

- 3,000 Psi @ Two point five (2.5) gallons per minute

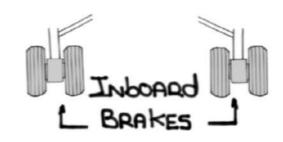

- PRIMARY FUNCTION :

Hydraulic pressure for utility systems during ground and maintenance activities

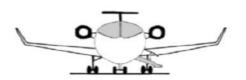

· LANDING GEAR

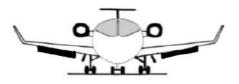

BRAKES

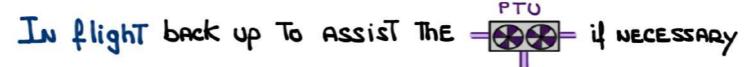

· MAIN LOOR

FLAps

- Nose Wheel Steering
- SECONDARY FUNCTION:

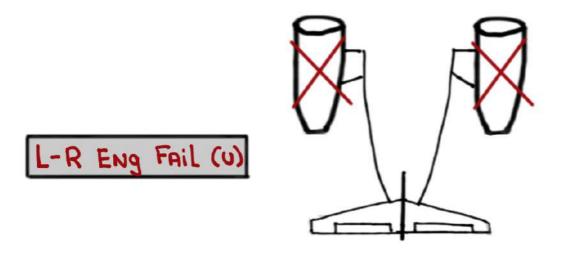

- Auto Operation In Flight:

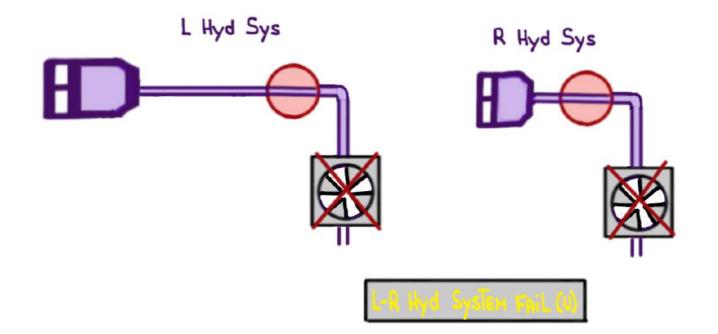

NORMAlly iNACTIVE IN Flight but will power ON AUTOMATICALLY FOR THE OPERATION of LANDING GEAR AND FLAPS

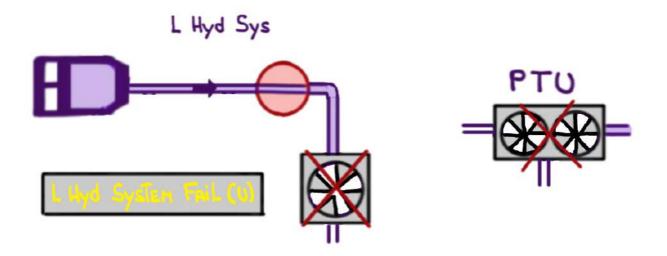

DUAL ENGINE FAILURE

2 DUAL ENGINE-DRIVEN PUMP FAILURE

3 LEFT ENGINE-DRIVEN PUMP AND PTU FAILURE

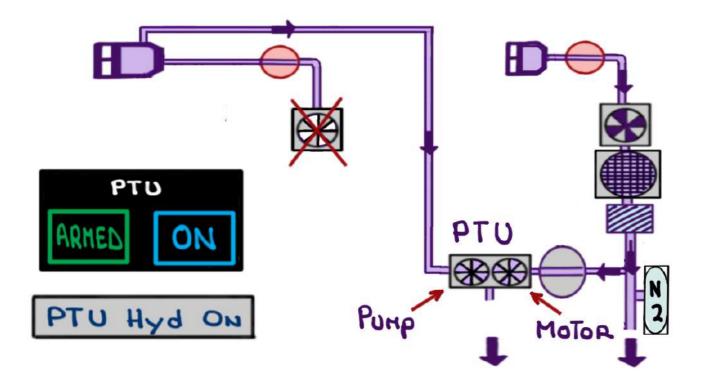

- REQUIREMENTS FOR AUTO ON OPERATION:

- · AUX pump ARMED (default mode at power up)
- · AUX pump NOT overloaded / overheated
- LEFT SYSTEM PRESSURE < 1,500 Psi
- Left system fluid available and not hot (> 0.36 gallons and < 107°c)
- Flaps or gear position does not match handle position > 100 kcas
- After the flaps or gear reaches its selected position. The AUX pump switches itself OFF

- Openation Limitations:
- IN flight when the AUX pump has been manually selected ON it will go OFF after two (2) minutes of operation. The Timer can be reset by turning the AUX pump OFF Then ON
- · There are no Time limitations on the ground

POWER TRANSFER UNIT (PTU)

- <u>Back up</u> to the LEIT Hydraulic System Engine - driven pump (operational redundancy)

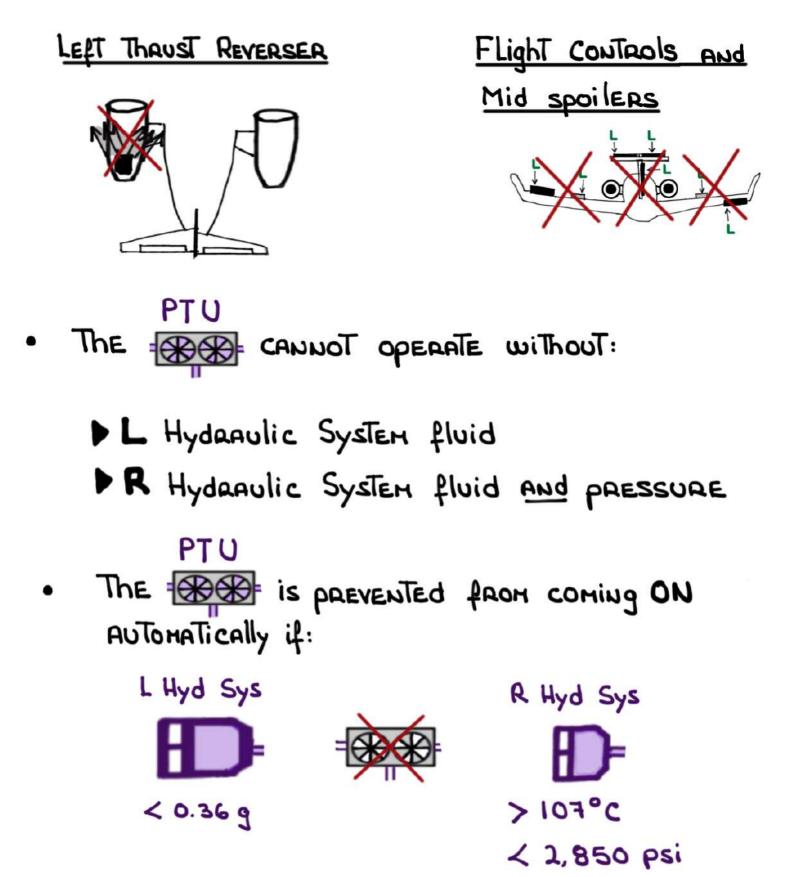

PTU

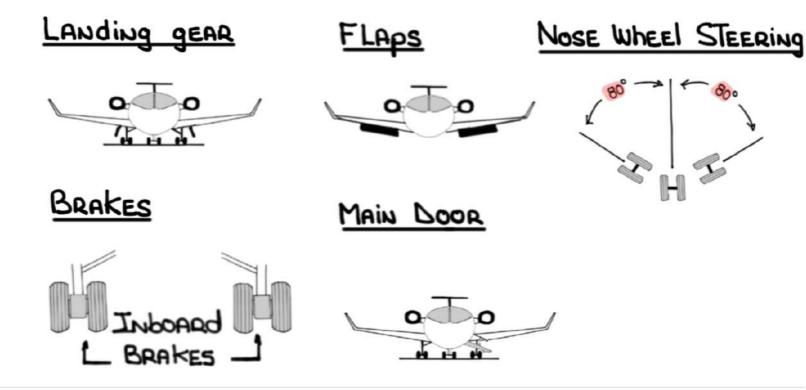

• The the is a motor/pump assembly

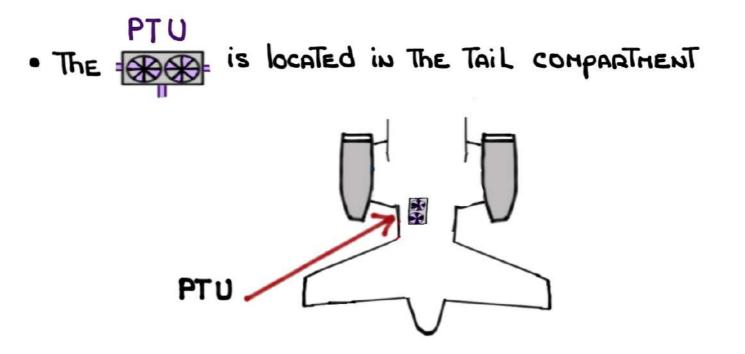

The motor is driven by Right System pressurized fluid. The pump is driven by The motor and its job is to pressurize Left System fluid

• IT COMES ON AUTOMATICALLY IF L HYDRAULIC SYSTEM PRESSURE is < 2,400 psi . IT CANNOT ACTUATE:

- · OPERATES EiTHER AUTOMATICALLY OR MANUALLY
- 3,000 Psi @ 23 gallous per Minute
- Helps Retract the Landing gear following a failure of the left engine after takeoff (regulatory requirement)
 PTU = "Pick Tires Up"
- IT USES:
 (1) Right system pressurized fluid, and
 (2) Left system fluid
 - . IT CAN ACTUATE:

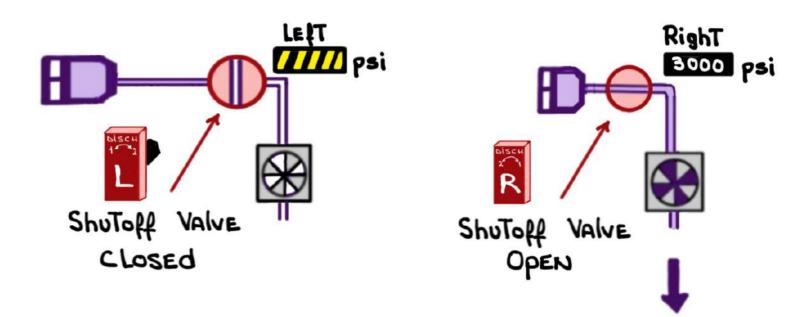

• WHEN ARMED IT HAS A SEVEN (7) SECOND DEBOUNCE. This MEANS THAT IT WILL RUN AT LEAST SEVEN (7) SECONDS TO PREVENT INTERMITTENT OPERATION WITH FLUCTUATING LEFT SYSTEM PRESSURE. This is CONTRolled by THE DCN

DEACTIVATION:

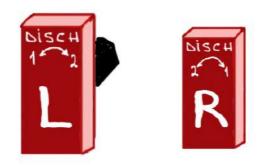

- Seven (3) seconds after Left System pressure Recovers > 2,850 Psi
- IMMEDIATELY if Right System pressure daops < 2,400 Psi</p>

Hydraulic Shutoff VALVES

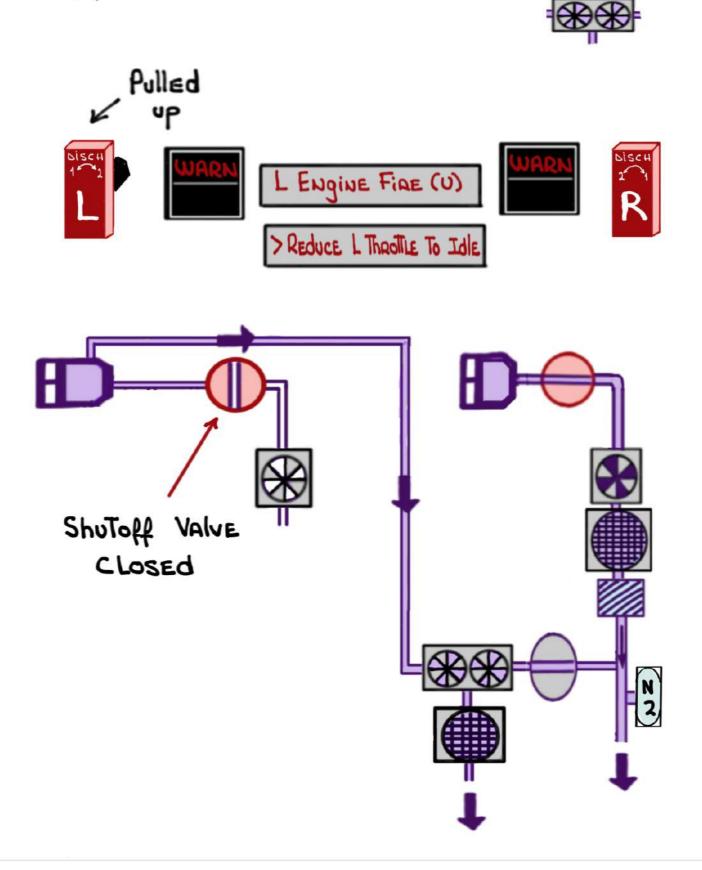

The hydraulic shutoff values are located in the Tail compartment and <u>isolate</u> the hydraulic fluid from The engine-driven pumps

The hydraulic shutoff values are motor-operated and energized only when the Engine fire handles in the cockpit are pulled

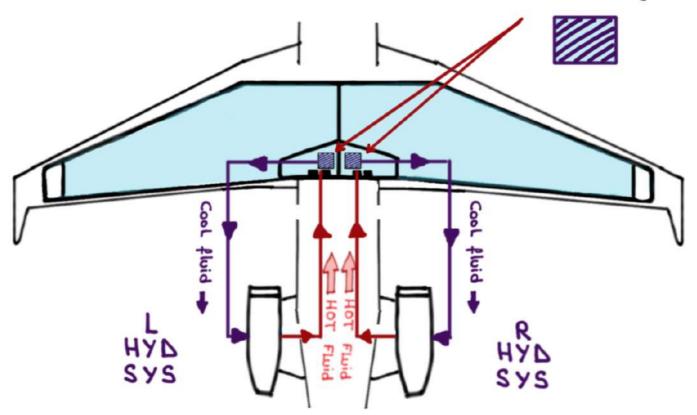

• Pulling The LEFT FIRE HANDLE does NOT shut off The supply of LEFT System fluid to The PTU

Hydraulic fluid HEAT Exchanger

- The Hopper Tanks contain the Hydraulic fluid-tofuel Radiator Type HEAT Exchangers

> Hydraulie/Fuel HEAT Exchanger

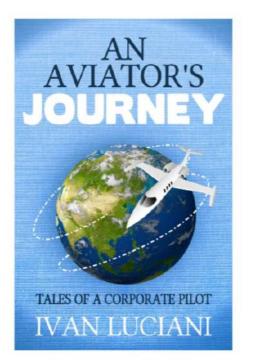

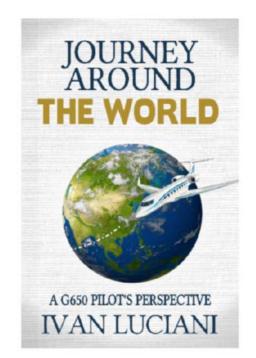

The <u>HEAT Exchanger</u> unit is inside the onside fuel Hopper. HOT hydraulic fluid flows continuously Through the <u>HEAT Exchanger</u> without pilot input

HOT Hydraulic fluid is cooled while COLD fuel in The Hopper is warned up REMINDER: these system notes are intended for study purposes only. Always refer to official Gulfstream manuals and other approved references when operating your aircraft.

NOTE: these system notes are updated from time to time and what is posted on Code450.com will always be the most recent version.
